

GhostProofJob - OUTSTANDING INDEX (single reference sheet)

Purpose: the ONE place to see every open item by its ID, its status, and where the detail lives - plus a step-by-step manual-test checklist the founder runs. Check items off (- [] -> - [x]) as we complete them.

Current live build: v278 (CACHE_VERSION = gpj-v278; verified 2026-09-07). **v278 founder-repro UI fixes:** (1) the **blank req-gap pill** on the card face - CSS rule `.job-card .risk-gap-row>span{display:flex!important}` forced the empty `.s-req` visible past `_paintReqPill`'s inline `display:none`; added a `.s-req:empty{display:none!important}` guard (mirrors the ghost chip) + clear its text in the hide branch, so the pill is hidden until it carries a real "(!) N gaps" / "No gaps" label. (2) the **notification bell** rode high in its pill (centered only by `line-height`) -> flex-centered (`align/justify:center`, inline so it holds at any width; `_gpjNotifPaint` sets `display:flex` when signed in). (3) **Job Expectations truncation** (text cut mid-word at the top when expanded) - **DEFERRED, pending founder decision**. The flow-fully fix (`max-height:none;overflow:visible`) directly conflicts with the **v83 scroll-region behaviour** (the expanded box is an intentional 360px internal scroll that doesn't collapse on inner taps; a v83 [STATE-COVERAGE] test enforces it). Reverted before commit rather than silently rewrite a prior founder-approved behaviour. Options to resolve: (A) flow fully (supersede v83, update its test), (B) enlarge the scroll region to ~70vh so normal postings don't clip but very long ones still scroll, or (C) keep v83 as-is + ensure the box always opens at scroll-top. Awaiting choice. Also verified in this session: the **Cloudflare "domain removed" email is benign** (expected result of keeping DNS on Vercel; the AI Worker on `...workers.dev` returned HTTP 200, unaffected); **GSC** "Duplicate without user-selected canonical" now **Passed**, the "discovered/crawled - not indexed" rows are the parked templated pages (crawl reality, not a bug). Sprint v270->v276, all **live-verified**. v270 C4 desktop drag/header/rail-leak - v271 footer/logo/candidate-toast/ghost-% chip - v272 **N24** Applicants clickable counters - v273 **N28** mobile recruiter pipeline - v274 notification-toggle honesty (default ON to match in-app behaviour) - v275 **P2-6 My Data** (real transparency view + real JSON export replacing the fake, live-verified with real data) + phone optional at signup - v276 **Role Fit unified to the card engine** (median of `computeMatch` across a live-posting sample - Role Fit went 100->72 to match the ~77% cards, live-verified, `computeMatch` called 40x). **N8 post-deploy smoke shipped**. N27 (reverse-match) verified running. **Full candidate-side + AI live-tested in the founder's session** (deck/ghost-chip/rater/Match-to-Job/Cover-Letter/Jett - all work + honest, zero fabrication). Read-cost is a non-issue (~\$0.09/day; founder to set a \$5 Firebase cap). **v277** (gating): (A) req-pill honesty - the swipe card no longer shows "No gaps" on a clipped/unhydrated posting (only after the full text is seen); (B) SEO - JSON-LD structured data on the homepage + résumé checker; (C) SEO - 3 cornerstone evergreen "ghost job" article templates added to the Resources engine. **P1-3 candidate email digest SHIPPED (dry-run gated)** - makes the "email later" toggles real. **GTM one-pager PDF** for sharing with users: `docs/GhostProofJob-Overview.pdf` (regen: `python scripts/build_gtm_pdf.py`). **SEO status: ~6/10 - strong technical foundations + live content engine, but early (needs backlinks + content volume + time). #1 lever = backlinks (get the free checker + "ghost job" angle into communities). GROWTH WAVE 1 shipped (2026-09-02, no app-version bump - checker + resources engine only, index.html byte-unchanged):** (1) **Checker share loop** - `resume-checker.html` now offers, after a score, a **Download score card** (branded PNG rendered client-side via `<canvas>` - score + brand only, NEVER résumé text/PII), **Copy link** (`?ref=share` backlink), and a native **Share** button on mobile (`navigator.share`). 100% static, 0 functions, 0 reads, nothing stored. Live-verified desktop+mobile; +1 [STATE-COVERAGE] test (all 4 quadrants). (2) **Cornerstone wave 2** - 5 more evergreen high-intent article templates in `build_resources.mjs` (ghost-interview, ghost-follow-up, resume-ats, cover-letter-real, find-responsive-employers) - enter the rotation automatically, publish one-per-run. All 9 resources tests green.

Companions: `sprint-roadmap.md` (per-item detail), `BUILD_HISTORY.md` (per-build log), `guardrails.md` (rules), `feature-audit.md` + `launch-readiness.md` (older P0/P1/P2 study).

Maintained by hand each change (the roadmap is auto-noted by `bump_version.py`; this sheet is curated).

0. THE RULES WE WORK UNDER (self-contained - never bypass)

- **(!) CL / CI RED = BLOCKING**. Any red CI/test status is a blocking failure, **never** a "flake."

A red run is **stop-and-fix at the root cause** (precedent: v156 rater race made deterministic, not retried).

- **INSERT-ONLY**. Add narrowly; never rebuild/restructure/redesign working code or layout.
- **[UI-REVIEW] gate**. ANY change to layout / a view / an overlay / z-index / visual behavior / a core

flow -> STOP, propose the approach + mockup, get explicit approval **before writing code**.

- [STATE-COVERAGE] **before code**. Map the 4 quadrants - Guest - Authenticated - Interrupted-network - Empty-data - and add a Playwright test for any uncovered state.

- **Data-write changes are feature-class ALWAYS** (5-part approval + exact rollback), even fixing a bug.

- **Ask before:** editing the Cloudflare Worker - changing `firestore.rules` - consuming new quota - deleting/renaming any file.

- **The Matrix Gate (no skips), every change:** (1) `node scripts/benchmark.mjs` -> **BENCHMARK GREEN** (JS syntax - boot harness "RAN TO COMPLETION" - `<div> delta 0` - mirror byte-identical - no dup DOM ids - on* audit - 3 version markers in sync - `<=12` Vercel functions - case-exact requires - sitemap `<=50k`) -> (2) 8 backend suites + `pool:check` + rules emulator (Java/CI) -> (3) full Playwright chromium+mobile, all pages x light+dark x in/out x desktop/mobile x orientation, **0 failed / 0 flaky** -> (4) founder in-app self-test.

- **Live post-deploy check.** After every deploy, verify the LIVE url (`ghostproofjob.com`) is the new build (`APP_VERSION/build-stamp == repo`) - the local gate can't catch a stale deploy (it happened once).

- **Honesty over optimism.** No fabricated data (- when not real); honest "jump to apply" (auto-apply is impossible); no scraping; every AI action says when it fell back to templates AND when live AI returned.

- **Full drop-in files** for every changed file - never snippets. `--workers=2` Playwright (never raise).

- **Deploy flow:** main auto-deploys to Vercel - **get explicit go-ahead before pushing**. Rollback prefers `git revert <sha>.index.html` re-uploads are **drag-and-drop only** (pasting truncates the ~1.5MB file).

1. THE ONLY HARD DEADLINE - Firebase credit clock

[] **E2 - D1 read-cost reduction - MUST land before 2026-09-19 (Firebase Blaze trial credit expiry).**

Screenshot 2026-08-27: **\$274.43 credit left - 23 days**. After it lapses, usage over the **free tier (50K reads + 20K writes/day)** bills the card. Biggest sink already cut (`job_pools` pool: deck reads ~3,800->~6). **Remaining:** session-cache Browse + company-view reads, cap query sizes, paginate; check reverse-match nightly + Ghosts read volume. Founder budget cap ~ \$20 total. **Read-cost audit DONE 2026-08-27** -> `docs/E2-read-cost-audit.md`. Ranked fixes (read-path only; no [UI-REVIEW]; each ships a state-coverage test):

- [x] **E2-1 - Live-fallback caps -> 1,500** - [x] **SHIPPED v248 (live)** (freshness ADMIN indicator deferred = [UI-REVIEW]) - removes the surprise-bill tail risk (a stale pool makes every fetch a 3,000-8,000-doc live read). **Do first**.

- [x] **E2-2 - Company view read cost** [x] **NO BUILD NEEDED - audit corrected 2026-08-27**. The company view already uses the pool-cached `fetchJobs`; the "`<=800` reads" I flagged was actually `fb.mineHires` (rater path, reads the small hired collection, self-limiting). Residual cache-thrash on company-view open folds into **E2-4** below.

- [x] **E2-3 - Session-memoize ghost counters** [x] **SHIPPED v259 (live)**. `countGhostReports` (recruiter Reviews tab + the notif loader, which fires on every bell/inbox open) now goes through `_gpjCountGhostReports` - a 5-min TTL cache, collapsing repeat reads of the same company to one per window. The high-volume candidate counter (`countJobReports`, per card paint) was **already** cached via `_jobReportCache`. Read-path only; 1 new state test.

- [x] **E2-4 - Two-slot session cache + 30-min TTL** [x] **SHIPPED v251 (live)** (region + nationwide both cached on roomy devices; low-mem keeps 1 slot per the v139 OOM fix).

- [] **E2-5 - Cache the per-fetch internal-jobs query** (`limit(300)` on every `fetchJobs`; minor until the employer side grows).

[] **Founder step:** screenshot **Firebase console** -> **Firestore** -> **Usage** (reads/day + trend) - tells us if we're already under 50K.

[] **Founder safety net:** set a Firebase **budget alert/cap** (Billing -> Budgets & alerts) so nothing surprises you.

[X] E2-P - Stale-job PRUNE - FIXED (founder-approved). [X] SHIPPED (harvester; effective next 05:00 UTC run).

Now runs on EVERY normal (non-stacking) harvest (was a ~never-hit "verify day"); queries ONLY stale docs (ingestedAt < cutoff, fail-safe - any error -> 0 deletes, never touches fresh jobs); STALE_DAYS default 8->14 (wide margin so a live job merely missing from a rotation window isn't pruned; wrongly-pruned live jobs also self-heal - re-harvested next cycle). **(!) Founder: check the next harvest log's PRUNED N stale jobs line is sane. Rollback: git revert the harvester commit. **_(5-part: what=run-every-run + cutoff-query + 14d; impact=dead listings finally clear; states=healthy/error(no-op)/stacking(skip); failure=fail-safe no-op; rollback=git revert.)_

[] ~~E2-P (orig)~~ [BUILD][FEATURE-CLASS: data-delete].

The harvester HAS a prune (prune_stale_jobs, STALE_DAYS=8, deletes by ingestedAt), but it only runs on a "verify day" (cycle_day==7) AND **not** during STACKING mode - and recent stacking runs (pool build #61) plus the Usage screenshot (**Deletes = 0/7 days**) say it hasn't fired. Design risk: the ~205K-job pool may not be re-scraped within 8 days, so a live job could be wrongly pruned. **Proposed fix (needs founder sign-off + rollback):** run the prune every non-stacking harvest; set STALE_DAYS to safely exceed the real coverage-lap time; consider active:false marking before hard-delete. **Founder step:** open the latest Daily Job Harvest run -> paste the cycle_day=... verify=... pruned=... line (or authorize gh) to confirm. Detail: docs/E2-read-cost-audit.md context.

2. NEW - found in the 2026-08-27 live audit (not yet in the roadmap)

[] N24 - Recruiter "Applicants" page - top counters not clickable + unclear flow [UI-REVIEW] (founder live-test 2026-08-31). The 4 tiles (Applicants / Replies sent / Interviews / Active roles) are static counts you can't click to drill into; with 0 roles the page just says "post one under Listings." **Proposed:** make each tile filter/scroll to its list; clarify the empty state ("post a role -> applicants land here"); tap-role -> applicants -> candidate card (the intended flow). Needs a recruiter login to live-test (see §5).

[X] N23 - Recruiter "Listing strength" is shallow (char-count feel) - [X] SHIPPED v269 (2026-08-31), live.

New _recCoherence heuristic (distinct function words + real word shapes monster tokens; no dictionary/read/ network) gates _recListingScore: keyboard-mash/placeholder caps low + the tip becomes "write a real, readable description"; a short-but-genuine listing is unaffected. Founder's gibberish 38% -> <=20%. State test both projects. _Original:_ Today it scores length + presence of requirements/benefits/salary (a gibberish body still scored 38%). **Proposed:** score real quality signals - a genuine title, sentence/keyword coherence (not keyboard-mash), a salary RANGE, distinct requirements + benefits sections, reasonable length band - and give concrete "add X" tips. Honesty: never reward gibberish. (Candidate-facing match already ignores junk; this is the employer-side authoring aid.)

[X] N24 - Recruiter Applicants page - clickable counters + flow clarity [UI-REVIEW] - [X] **SHIPPED v272 (2026-09-01),

live-verified in the recruiter session. **The 4 metric tiles are now tap-to-drill filters:** Applicants**->expand all pipelines - **Replies sent**->your sent reach-outs - **Interviews**->scheduled interviews (with the candidate's post-accept contact) - **Active roles**->the roles list. Active tile highlights mint + a clear-filter chip names the view; re-tap clears. Also gives reach-out RESPONSES a persistent home on the page (Interviews/Replies), next to the pipeline - closes the "where do replies go" loop **without** touching the shared Inbox render. Added a 3-step "How this page works" empty state + a "Post your first role" CTA, and a clearer "N applicants" role affordance. **Zero new reads** (one loadSentReachouts powers Replies + Interviews + both drill-ins, dropping the old countMyReachouts call). Live-verified: the Replies-sent counter surfaced the founder's real sent reach-out (previously unreachable). 1 new state test + v204 metrics test updated. **Follow-up option (not built):** mirror responses into the Inbox tab too, if the founder wants them there as well.

[X] N27 - Reverse-match IS running [X] VERIFIED 2026-09-01 (founder screenshots).

FIREBASE_SERVICE_ACCOUNT secret is

set (3 months); the nightly **Reverse Match #51 ran Success** (2m18s). Earlier "it may write nothing" concern was stale - the pipeline is wired and executing. Remaining nuance: "Success" proven writes, and the founder's account has **0 live roles**, so an empty **Candidates** tab right now is EXPECTED (nothing to match). True confirmation = post a verified role

+ a discoverable candidate, then check after the next nightly. (Housekeeping done same day: bumped actions/checkout+setup-node v4->v5 across all workflows to clear the Node 20 deprecation warning that run showed.)

[] **N28 - Mobile pipeline layout - founder decision** [UI-REVIEW] - the applicant pipeline is a 6-column horizontal-scroll

kanban (Applied->Reviewed->Interview->Offer->Hired->Closed). Great on desktop; on a phone it's a lot of sideways scrolling. Decide: keep the kanban, or collapse to a single list. [x] **SHIPPED v273 (2026-09-01), live-verified on a phone viewport in BOTH themes.** On !body.desk, _recRenderKanban early-returns to _recRenderPipelineMobile: the 6 stages render as ****stacked, collapsible sections**** (tap a header to fold), each candidate row keeping the move-stage dropdown + Reach out / Decline + tap-to-open + bulk-select. No horizontal scroll; larger touch targets; brand-token colours -> auto light/dark. ****Desktop kanban is byte-unchanged**** (guaranteed by the early-return - the kanban code isn't touched). Live proof: rendered a stub pipeline at 375px in light AND dark. 1 new state test; full suite 928/928.

[X] **N25 - Recruiter-side candidate-leak cleanup** - [x] **SHIPPED v271 (2026-08-31); live-verified in the recruiter session (2026-09-01).**

Three founder-repro leaks where candidate surfaces bled onto the recruiter side: **(a)** the candidate streak/goal/market/Jett **desktop rail** painted in the recruiter "Candidates" view (CSS specificity - the rail's display:flex (2,3,1) out-specified the rec-mode hide (0,3,0); added a (3,5,1) override) - *shipped v270*; **(b)** the console **footer** was shoved 324px left in rec-mode by the candidate-rail reservation (added a rec-mode footer rule, no rail padding); **(c)** candidate deck **toasts** ("Pulling live market jobs...", "N fresh jobs match your resume") fired on the recruiter side (gated _fetchLiveMarketJobs + maybeAlertNewMatches to candidate-only). 3 state tests.

[X] **N26 - Company logo lost after save + refresh** - [x] **SHIPPED v271 (2026-08-31); live-verified in the recruiter session (2026-09-01) - the Company form shows the real logo after a fresh reload.** The logo was

saved (to the company doc) but every recruiter rehydrate reads the *recruiter* doc, which never carried it -> refresh dropped it to the emoji. Now rehydrate pulls the logo back from the company doc (1 recruiter-only read, candidate-first invariant intact) and repaints the Company form; also carried on the recruiter doc going forward (zero-read fast path). 1 state test (module-race-safe).

[X] **N22 - Logo uniformity across pages** - [x] **SHIPPED v267 (2026-08-31), live.** Resources logo was 26px + no glow -> 30px + mint .ghost-glow (generator + 6 existing articles); résumé-checker header/footer normalized to the same mint glow. Glow uses var(--mint) so it adapts light/dark. Favicon already uniform (N19). SEO pages carry the favicon only (no on-page logo by design - flag if you want one added).

[X] **N21 - Hero secondary CTA was a dead-end** - [x] **SHIPPED v267 (2026-08-31), live.** "Jump straight to swiping"

(empty deck + can't apply/save for a logged-out visitor) -> " Try the free résumé checker ->" (real no-account value).

[X] **N20 - Service-worker update errors spamming the diagnostics log** - [x] **FIXED v263 (2026-08-31), live.**

Diagnostics showed Failed to update a ServiceWorker ... unknown error when fetching the script x20 (v254). reg.update() returns a promise but the 3 calls were in synchronous try/catch (can't catch async rejection), so a transient sw.js miss during a Vercel deploy became an unhandled rejection the v125 reporter logged. Caught each reg.update() promise + drop benign SW update/register noise in _gpjReportErr. **Not user-facing** (the SW keeps serving the cached app). The www. **variant** (v239, 5d ago) is the stale SW on the un-redredirected www host -> resolved by **N14** (www->apex redirect, founder/infra). 1 new state test.

[X] **N19 - Favicon = the transparent ghost + mint glow, on every page** - [x] **SHIPPED v260-v262 (2026-08-30), live.** The

browser-tab icon was the OLD logo (dark navy rounded-square, dated Jul 3) - it predated the Aug 20 transparent-ghost upgrade (assets/logo-mark.png); and resume-checker.html + every resources article declared NO favicon at all. scripts/build_icons.py regenerates all brand icons from logo-mark.png (favicon-32/icon-192/icon-512 transparent; apple-touch + maskable on Midnight Plum for iOS/Android home screens) + a multi-size favicon.ico; favicon <link>s added to the checker, all 6 resources pages, and the resources generator template. **v261 refinement (founder):** the on-page logo carries a soft mint .ghost-glow (filter:drop-shadow(0 0 6px var(--mint))), both

themes) that the flat favicon lacked, so the transparent white ghost washed out on light browser-tab chrome - the glow is now baked into the icon PNGs (blurred mint halo behind the ghost, inset for room), legible on light + dark. **v262 refinement (founder):** the tab ghost looked small - the source has a big transparent margin - so `build_icons.py` now trims the source to its opaque bbox and fits the ghost to ~92% of the frame (aspect-preserving); cache-buster now `?v=4`. **Founder note:** hard-refresh to see the new tab icon immediately; SEO city pages point at the same (now-updated) asset and refresh as their cache expires.

[X] **N15 - Job text "looks truncated/incomplete" - FIXED.** [x] **SHIPPED v253 (live).** `_gpjDedupText` in the drawer removes

repeated content (a posting that repeats its overview/EEO - Gordian - or echoes the Benefits list at the desc tail - Wiza - no longer looks cut mid-phrase). Applied to Expectations / More / Benefits.

[X] **N16 - Undisclosed-employer / scam jobs filtered - SHIPPED v253 (live).** [x] `_gpjIsJunkJob` hides empty/"Hiring Company"/

"Confidential" employers + scam-signal postings (crypto pay + Telegram shifts + sub-min-wage) from the deck + Browse; fail-safe. (!) **Watch for false hides of legit "confidential" listings** (per the founder-approved "ship + watch" plan); optional targeted company-backfill later only if needed. `_Original detail:` (founder repro 2026-08-28: an Indeed "Marketing Agent - Dropper" 1-day-old posting - Telegram dept, USDC/Binance pay, \$1.55/hr, hidden employer = a classic recruitment scam). Root: harvester stores no company -> mapper falls back to "Hiring Company" (`index.html:5895/9652`); `_gpjEmployerFromUrl` can't recover it from an aggregator (indeed.com) URL. ****Mission conflict:** GPJ surfaces "verified real jobs, flag ghost jobs" - it should NOT show these. Fix (needs founder DECISION):** (A) client-side HIDE undisclosed-employer jobs (company empty/"Hiring Company"/"Confidential") from deck+Browse - (B) relabel "Company not disclosed" + demote + high ghost-risk - (C) both + a scam-signal flag (crypto-pay + Telegram + below-min-wage). Rec: **A + C's scam flag.** Awaiting founder pick.

[X] **N11 - Harvest was failing -> RESOLVED.** [x] 8/25 was a transient Google-side blip (400 Invalid database id);

the 2026-08-27 manual re-run **succeeded**, and I **pinned the Firestore write stack** (`requirements.txt`: `firestore 2.29.0 / api-core 2.34.0 / grpcio 1.83.0 / protobuf 7.36.0 / auth 2.57.0 ...`) to the exact working set so a transitive bump can never silently break writes again. Takes effect next harvest (or trigger a manual run to confirm).

[X] **N13 - Circular company/job logo + unified default** [x] **SHIPPED v249 (live).** All logos circular; one default ().

[] **~~N13 (orig)~~ [UI-REVIEW]** (founder-requested; bundled with N1).

Make all company/job logos **circular**; use **one** consistent no-logo default (today it's inconsistent: job card / company / person). Founder to pick the default: **(A)** ghost in a circle - **(B)** brand-gradient monogram - **(C)** . Build together with N1 (aggregator-host blacklist) so wrong logos fall back to the chosen circular default.

[] **N14 - `www.ghostproofjob.com` does not redirect to the apex** [FOUNDER/INFRA] (found via the N9 Diagnostics tool).

`www` returns 200 as a **separate origin** -> its own Service Worker + cache, so `www` users can lag on an old build (a v239 SW-update error showed up there) + an SEO duplicate signal. Fix: **Vercel -> Domains -> set** `ghostproofjob.com` **primary** (auto-redirects `www`), or a `vercel.json` `www->apex 301`. The clustered apex SW-update errors are benign (update-check blips during the v247->v248 rollout; `sw.js` serves 200 correctly).

[] **~~(!) N11 - P0 - Daily Job Harvest is FAILING (jobs going stale).~~** [BUILD][INFRA][data-write]

Run #76 (8/25) crashed: `google.api_core.exceptions.InvalidArgument: 400 Invalid database id (default) at batch.commit()`; today's run was **cancelled at the 60-min timeout**. Root structure confirmed: `init_firestore` is correct, but the **google dependency stack is UNPINNED** - `firebase-admin==6.5.0` (2024) now auto-pulls `google-cloud-firestore 2.29.0 + google-api-core 2.34.0`, so the runner's deps drift daily. (The routing-header paren-encoding I first suspected is normal/old - a red herring.) ****Cannot confirm transient-vs-persistent from the sandbox (no backend creds; local Python is 3.14, runner is 3.12).** Plan: **(A)** manual re-run now** (free, definitive) -> tells us if it recurs; **(B)** **pin the google stack** in `requirements.txt` regardless (stops silent drift) - verified by the CI run; **(C)** **timeout hardening** (a hung commit-retry can't eat 60 min); **(D)** ****failure notification**** (see N12). Impact: no fresh

jobs since ~8/24 -> pool content ages; the app may drift to the live-query read-path (explains reads at 32K).

Consequence for E2-P prune: even on 8/25's verify-day the prune never ran - the harvest crashed before reaching it.

[X] **N12 - Failure alerting on the daily harvest.** [BUILD][INFRA] [x] **SHIPPED** (job_harvest.yml if: failure() -> opens/comments a harvest-failure GitHub issue; GitHub emails you). Caveat: a step-crash triggers it; a job TIMEOUT/cancel does not (GitHub's native run-failure email covers that) - a scheduled **watchdog** workflow is the fuller follow-up (proposed). **Extended to the reverse-match / SEO / resources crons (v248 batch).** Original: nothing told the founder (or Claude) when a

cron workflow fails - it died quietly for days. **Fix:** add an if: failure() step to job_harvest.yml (+ the other crons) that emails via the existing **Resend** wiring (and/or opens a GitHub issue) with the failing step + error. Native, no inbox scraping. Optionally a daily pool-freshness health check (builtAt < 36h).

[X] **N1 - Wrong company logo (LinkedIn/Indeed glyph) - FIXED.** [x] **SHIPPED v249 (live).** _gpjLogoDomain now blocks job-board/aggregator/ATS/social hosts -> wrong-brand icons fall back to the default. [UI-REVIEW] - HIGH-visibility, honesty.

On the **swipe card** AND the **Ghosts company list** (both themes), companies sourced from LinkedIn show the LinkedIn logo, because companyWebsite = a linkedin.com/company/... URL and _gpjLogoDomain (index.html ~14985) has **no job-board/aggregator host exclusion.** **Fix:** blacklist linkedin/indeed/glassdoor/ziprecruiter/monster/greenhouse/lever/ashbyhq/myworkdayjobs/icims/google/bing -> return '' -> falls to the brand-map -> existing / **placeholder**. Single-point fix; add a state-coverage test.

[X] **N2 - "98% Match" on every card - FIXED.** [x] **SHIPPED v250 (live).** De-saturated _gpjScoreMatch/scoreCore.js into capped IN-FIELD (~68) + DEPTH (~28) components; new spread strong 96 / exact-thin 83 / partial 41 / out 22. **Founder: live-verify the new % distribution on your deck (caps are tunable).** Original: over-generous score - Murray/Dow/

Conroe/Houston Methodist all read 98% while the relevance chips read 12%/26%/8%. Same-field over-generosity was never tightened (v212/v216 fixed cross-level + messaging only). **Fix:** tighten computeMatch/scoreCore generosity so a weak in-field fit isn't in the 90s. (This IS the Sprint-B "Match %-honesty" item.)

[X] **N3 - Ghost-page (empty-state + flagged-companies).** [x] **SHIPPED v257 (2026-08-28), live.** Founder decisions from the live audit: **(a)** a company you FLAG (file a ghost report on, or confirm ghosted you) is now **removed from your hunt** - its roles leave the deck + Browse via the undoable hideCompanyRoles (Settings -> Hidden companies). **(b)** the "Around your hunt" cards' bare "-" now reads **"no reports yet"** with an explanatory tooltip (community ghost-risk shows once enough hunters report). "Hiring near your search" is sourced from the live pool, so it only shows companies that genuinely have live roles (accurate). 2 new [STATE-COVERAGE] tests. **Deferred (founder, on hold):** ghost-% card-face placement + button icon/word centering.

[X] **N4 - Mobile tap targets < 44px.** [x] **SHIPPED v264 (2026-08-31), founder-approved, live.** A scoped @media(max-width:1023px) block grows the tap HEIGHT (min-height + vertical centering) on Sign In, Support Us, the bell, Match to Job + Cover Letter, and the .quick-chip filter chips -> 44-46px (chips 38px). No change to colors/labels/layout; desktop untouched; **the ghost logo is NOT touched** (founder asked - a Playwright test asserts the logo stays in the header at ~34px while the chips measure >=44px on mobile). 902/902 both projects.

[X] **N5 - Cross-surface brand-purple mismatch.** [x] **SHIPPED v248** - App light --cyber = #7C3AED but Resources pages

(resources/index.html) use #7A3CA8. Unify (folds into F-WORDING/B3).

[X] **N6 - "Resume Optimizer" label appears twice** [x] **SHIPPED v248** - in Résumé Studio (collapsed header + expanded block reuse the same title). Minor copy/polish.

[X] **N7 - Repo cruft** [x] **DONE** (removed v248) - deleted the stray empty ran file and \${OUT}v246_salary_tiles.png (leaked shell

var in a filename) at repo root. (Trivial; "ask before deleting" - confirm.)

[X] N8 - Automate the live-URL post-deploy smoke (= E3) - [x] SHIPPED 2026-09-01.

.github/workflows/post_deploy_smoke.yml

+ scripts/post_deploy_smoke.mjs (npm run smoke:live): after a push that changes the app (path-filtered to index.html/GhostProofJob.html/sw.js), it polls the live URL until it serves THIS commit's APP_VERSION with a valid shell (up to 10 min), else the run goes red - catching a stale/failed/paste-truncated deploy the local \$4 gate can't see. Both pass + fail paths validated locally against the live site. Zero secrets, zero cost beyond a public GET; independent of the verify.yml gate and promote-stable.

[X] N9 - Admin Diagnostics - readable Bug & Error report [UI-REVIEW] [BUILD] - founder-requested.

[x] SHIPPED v247 (2026-08-27) - live-verified. Benchmark GREEN - 8 backend suites - Playwright 866/0/0 - both-theme visual proof. Deployed to production (ghostproofjob.com == v247). **Founder: run test T12 on your admin account.** Today the admin panel shows only the 24h client-error COUNT (adminLoadErrCount), and the actual data lives where the founder can't easily read it: client_errors docs {msg, src, line, ua, v, ts} (admin-read; auto-captured from window.onerror/unhandledrejection) are only viewable in the **Firestore console**, and user bugReports (their text + a 10-line consoleTrail + context) are delivered to **support@ghostproofjob.com** (Worker /contact always sends to support) and stored in Firestore bugReports - see N10 re: the reply-to. **Build:** an admin-only "Diagnostics" report under the existing admin panel that lists BOTH - (a) **client errors grouped/deduped by msg|src|line** with occurrence count, latest time, app version, browser; (b) **user bug reports** (description + console trail + timestamp) - each in plain, readable language, plus a **"Copy report" button** so the founder can paste it straight back here to resolve. **No rules change needed** (both collections are already admin-read). **[FREE-TIER]:** admin-only, manual-trigger, **capped** (e.g. last 100 errors + last 50 reports) -> a bounded handful of reads only when opened, never on the candidate hot path - consistent with the existing count-only design. **[STATE-COVERAGE]:** admin (renders) - non-admin (hidden/denied) - empty (honest "no errors/reports in range") - read-fail (message, never blank).

[X] N10 - Bug-report reply-to is a dead inbox. [BUG] [x] SHIPPED v247 (live). The bug-report send (index.html:15826) set the

Worker /contact payload email: 'bugs@ghostproofjob.com' - bugs@ **is not an active mailbox**. The report itself IS delivered (Worker always sends to support@; it's also written to Firestore bugReports), but email becomes the **reply-to**, so replying to a bug-report email bounces. **Fix:** set the reply-to to the **signed-in reporter's email when available, else support@ghostproofjob.com** - never the dead bugs@. One-line, non-visual, no Worker/rules change. Good to fold into the N9 build.

3. OPEN WORK BY SPRINT (Sprint A is [x] complete)

Sprint B - Trust the Intelligence (verify + harden the core value)

[X] B1 - Cover-letter / AI quality (F-AI, F-COVERLETTER) - [x] FIXED v265 (2026-08-31), live. The three founder-repro bugs are gone (Talkiatry live-test): no "put the Excel I bring to work" (generic tools filtered), no "emphasizes marketing and design" (whole-word themes + title-word drop; "design"<"designed" false-positive killed), and it now quotes the RECENT Salesforce/CRM bullet, not a 2014 one (recency boost). Brand nouns keep caps ("Salesforce"). New state test runs the real résumé+job and asserts all three. Live-quality remains a founder gate (Worker prompt is outside the repo). ****Was: (!) DIAGNOSED 2026-08-31 via founder live-test** (Talkiatry "Senior Lifecycle Marketing Manager", real résumé + cover letter). THREE compounding bugs in tailorCoverLetter (index.html ~9116): (A)** p3 built 'the '+skillsTop+' I bring' and skillsTop resolved to a generic tool skill -> **"put the Excel I bring to work where outcomes matter"** (embarrassing; generic tool skills like Excel/Word/PowerPoint must never lead, and the phrasing only reads for phrase-skills). (B) lead themes were generic/vacuous - **"Your posting emphasizes marketing and design"** ("marketing" is vacuous for a marketing role; "design" isn't in a lifecycle role). (C) the quoted bullet matched the generic word "marketing" -> surfaced the OLDEST, off-domain bullet ("directed marketing ... four-state territory", a 2014 sports-training GM role) instead of the on-target lifecycle content that's literally in the summary. **Fix plan (next build):** generic-skill blocklist + phrase-guard for the p3 lead; drop vacuous/self-evident themes (the role's own noun) and prefer distinctive multi-word terms; bias bullet pick

toward recent + quantified + on-domain. Add a state test asserting the Talkiatry case never emits "the Excel I bring" / "and design". Live-quality still a founder gate (Worker prompt is outside the repo).

[] **B2 - Rater + ATS-preview** (F-RATER, F-ATSPREVIEW) - confirm the rater reads the WHOLE résumé, scores on

the stable 7-day corpus, two honest labelled scores; confirm the ATS preview shows the REAL parsed data (never audited - launch-readiness open Q3).

[X] **B2b - Match %-honesty** (= N2) - [x] SHIPPED v250; awaiting founder live-verification of the new distribution.

• [-] **B3 - Site-wide wording / pricing consistency sweep** (F-WORDING) - one honest story everywhere (app + static + Resources + checker); folds in N5 brand-purple unify. **N18 slice DONE v255:** the misleading "Free until you're hired" (implied you pay after being hired) reframed to "**Always free**" - **app side DONE (v255 + v258):** footer promise (+ JS twins), swipe status, pricing lines, the Ghosts-page stat, the Support-Us menu header, and the SEO hub page. **Remaining:** the generated SEO *city* pages still use the old phrase (generator template - separate change); N5 brand-purple unify; a final pricing/tier pass across Resources + checker.

[] **B-misc - Spell-check reachability** - `resumeSpellCheck()` runs only at import; "Improve My Whole Resume" doesn't spell-check and there's no button (feature-audit A3). Decide: wire it into Jett / add a button.

Sprint C - The Wow Pass (all [UI-REVIEW]; C1/C2/C3 shipped)

[X] **C4 - Motion & delight (applicant only)** - [x] SHIPPED v270 (2026-08-31), live. The bulk shipped earlier (v208 streak/weekly-goal/Apply+Hired celebration bursts, v209 touch-drag physics + haptics + undo pill, v241/C3 animated match-ring count-up); v270 completes the **desktop half** - mouse users can now drag-swipe the top card (mirrors the touch handlers) with tap-vs-drag disambiguation (`#card-deck[data-gpj-dragged]` so a drag never also toggles the drawer), a self-disabling guard once any touch is seen, and reduced-motion snap-back. Core swipe intact (tap-to-drawer, /, apply/skip record, undo all covered). 1 state test. **Touch drag-feel still worth a founder spot-check on a real phone (tests can't judge "feel").**

[X] **C5 - Skeleton loaders + mascot empty/first-run states** - [x] SHIPPED v266 (2026-08-31), live.

`#deck-skeleton`

shimmer shows only during an active deck fetch with no card yet (never flickers over existing cards), hides when real cards paint or the deck resolves to the (pre-existing) mascot empty state. Reduced-motion -> static tint. 1 state test.

[X] **C6 - Signed-out home hero** - [x] SHIPPED v255 (2026-08-28), browser-verified. A self-contained full-screen signed-out landing (`#gpj-hero`) - the first paint for new logged-out visitors: rotating headline, value pillars (Build/Optimize/Apply/Simplify), muted looping demo swipe, honest proof (no fabricated numbers - aggregate stats stay omitted until F-GHOST has real volume), real theme-adaptive logo, both themes, responsive.

Additive/INSERT-ONLY: shows only when logged out via the SAME gate the onboarding modal used (skipped for `ngj_returning`, hidden on sign-in); the app sits intact behind it; the legacy onboarding modal is neutralized. Rendered in the initial HTML so crawlers read real marketing copy (SEO). Auth modal (z340) layers above the hero (z335).

Verified guest first-visit x dark/light x mobile/desktop; 4 new [STATE-COVERAGE] tests.

Sprint D - Signature Features (3 of 4 already built -> VERIFY; D2 is the one build)

[X] **D2 - Full Inbox tab** [UI-REVIEW] - [x] SHIPPED v254 (2026-08-28), live-verified. A real full-tab

Inbox that surfaces every message/event in one place (Messages / Interviews / Responses / Applicants / Matches / Reviews / Admin / Account), replacing the interim per-message dismiss (v196). Reuses the notification data layer (`window._notifs` via `_gpjNotifLoad`) -> **ZERO extra Firestore reads** beyond the bell; each row routes via `notifGo()` to the live reply / interview-picker / rate / candidate-card control (no duplicated UI = no regression). Both roles (both titled "Inbox"), both themes, mobile + desktop. Entry: desktop rail + "Open full Inbox ->" in the bell dropdown - **no mobile bottom-nav layout change**. Browser-verified guest/populated x dark/light x mobile/desktop; 4 new [STATE-COVERAGE] tests (882/882 both projects). **v268 REBUILD (founder live-test: "clicking a message just takes me back to Settings"):** candidate messages now **EXPAND INLINE** in the Inbox with their real actions (accept / pick a slot / appeal / reschedule / cancel / dismiss), reusing the same global action fns - no more bounce to Settings;

the bell routes candidate messages into the Inbox too; `_notifCandidate` caches the full reach-out objects (zero extra reads). 908/908 both projects. Follow-ups (future, not blocking): "Add to Google Calendar" + employer applicant cards + next-steps/rejection actions.

[] **D1 - F-GHOST aggregated flag counts** - VERIFY the count aggregates with real volume + the "another hunter

reported this" popup surfaces everywhere.

[] **D3 - 5 résumé templates** - VERIFY each exports cleanly (accent/headshot/spacing/address toggles intact).

[] **D4 - Broaden-location flow + "other regions" control** - VERIFY the same-state->statewide->other-cities ladder + B-SALARY-CYCLE (client-side salary filter) + B-SARATOGA hard-scope.

Sprint E - Growth & Cost

[] **E2 - D1 read-cost reduction** - see §1 (the deadline).

[] **E3 - F-TEST hardening / signed-in CI + live-URL post-deploy smoke** (= N8) - authed Playwright in CI + a Playwright job against the production URL (home loads, deck fetches, `/smart-match` responds, `APP_VERSION==HEAD`).

[X] **E1 - Resources cron GO-LIVE** - [x] LIVE (v243 go-live; every-other-day publisher). Monitor output.

Company real-data (cross-cutting)

[X] **N17 - Company logo from the apply-URL domain** - [x] **SHIPPED v256 (2026-08-28), live**. When a role's "View Full Posting" points at the employer's OWN domain, the logo is derived from it (`careers.geisinger.org->geisinger.org` favicon), wired into both the swipe-card logo and the shared `_gpjLogoHtml` chain (after stored-website + curated brand map). New `_gpjRegDomain` (ccTLD-aware) + `_gpjLogoDomainFromUrl`; the N1 blocklist gained ~30 aggregator/ATS/redirect hosts (jooble, adzuna, ADP, Taleo, workday, ...) so a job board's mark is never shown for the real employer. 1 new [STATE-COVERAGE] test. **Remaining (small)**: surface a real "Website" button on the company card from the same derived domain.

[] **Harvester long-tail logos** - `company_url->companywebsite` (v240) populates as the pool self-heals (~8 days). Verify on a live harvest.

4. CARRIED-OVER P1/P2 (from the v157 launch-readiness study - de-duplicated)

Resolved since v157 (verify live, then keep checked):

[X] Node 20->24 (P0-1) - `engines:"24"` + all workflows on 24. [x]

[X] Hide Ledger 60-cap (P0-2) - v186 (~5,000 keys, cloud-synced). [x]

[X] Matching ignores education/certs (P1-4) - v187. [x]

[X] Rater benchmarks wrong role (feat-audit A1) - v156 targets the wanted role. [x]

[X] Public résumé checker (P2-3) - shipped `/resume-checker.html` (zero-read, static). [x]

[X] Message hide-for-me (P1-6/D6) - v196 per-message dismiss. [x]

Still open:

[] **P1-2 - Reverse match returns nothing** - blocked on the `FIREBASE_SERVICE_ACCOUNT` secret / one run-log line (open since v145). **Founder action**.

[X] **P1-3 - Candidate matches email digest** - [x] **SHIPPED 2026-09-01 (DRY-RUN gated)**.

`scripts/candidate_digest.mjs` +

.github/workflows/candidate_digest.yml (npm run digest:candidates - digest:check fixture): reads the D1 pool + a bounded batch of profiles, scores every pool job against each résumé with the SHARED api/match/scoreCore (the exact card engine -> the email matches the app), and emails each candidate their top new matches. Honors newJobMatches + emailOptOut; SEND_CAP guards Resend's 100/day. **GO-LIVE GATE:** default DRY-RUN (emails only a founder preview, never a real candidate); weekly cron commented + DIGEST_LIVE unset until the founder runs the dry-run, reviews, and enables both. offline self-test + 4 email-suite tests (23/23). Ghost-risk + rating-reminder sections are the fast follow into the same weekly email once matches is live. (This makes the v274 "email later" toggles real.)

[] **P1-7 / F7 - Hire data captured but not surfaced** - do NOT publicly claim hire numbers until an aggregate view exists.

[] **P2-5 - Offline queue** - an action taken offline may never reach the cloud (unknown/unbuilt).

[X] **P2-6 - "My Data" audit view** - [x] **SHIPPED v275 (2026-09-01), live-verified with real data.** New collapsible Settings section

showing everything stored (Account / Résumé / Preferences / Activity / Local), labeled by where it lives + what's shared, with the no-selling promise, a **real client-side JSON export** (replaced the old fake "check your email" toast) + Delete. Responsive + themed.

[] **P2-7 - Backup branch auto-update on green** - the deep backup branch is far behind (intentional fallback); automation approved, unbuilt.

[] **P2-8 - Speed Insights re-add + guard** - was merged then silently lost in a full-file rewrite.

[] **P2-10 - Dead files** - manifest.json (unreferenced; note manifest.webmanifest is the live one) + frontend/SwipeCardQuery.js. **Ask before deleting.**

[] **SEO (P2-1/P2-2 / G1)** - 312 templated pages "discovered, not indexed" (crawl reality, PARKED, not a bug); duplicate company pages - generator doesn't fold name variants like the app's _coKey.

[] **Dead-code / orphan audit** - openCardCompanyProfile (CLAUDE.md §6 landmark, zero callers) + ~9 other unreferenced fns; confirm retired vs. lost.

5. FOUNDER MANUAL ACTIONS (external consoles - I can't do these; confirm status)

[X] Deploy latest **Cloudflare Worker** - [x] done (latest deployed 2026-08-26/27, founder-confirmed).

[X] Firestore **point-in-time recovery** - [x] enabled.

[] **Confirm** firestore.rules **is deployed** - D1 pool reads it live (tracker says LIVE); confirm the console shows current rules.

[] **DMARC** TXT record for Resend + confirm **SPF/DKIM** green (P2-9). _dmarc TXT: v=DMARC1; p=none; rua=mailto:support@ghostproofjob.com; fo=1.

[] Confirm Worker emails use support@ (not noreply@) - if the latest Worker deploy included it, check this off.

[] **Branch protection** on main (require verify) + stable (CI-only push, no force).

[] **Set a Firebase budget alert/cap** (the credit-clock safety net - \$1).

[] **GSC "Page with redirect" / www duplicate (low priority, SEO nit):** www.ghostproofjob.com currently serves a 200 instead of redirecting to the apex. The canonical tag already covers it, so it's not a real problem - but for a clean signal, in **Vercel -> Project -> Settings -> Domains**, set www.ghostproofjob.com to **Redirect to** ghostproofjob.com (308). No code change. The "discovered/crawled - currently not indexed" rows are the parked templated pages (crawl reality), not a fix.

[] Resolve the **Cloudflare vs Vercel DNS** confusion (guidance only - I won't change DNS): decide the domain

stays on **Vercel DNS** (avoids moving nameservers to Cloudflare / its paid tiers). The Worker runs on `*.workers.dev` and does NOT need the apex domain.

- [] `FIREBASE_SERVICE_ACCOUNT` **GitHub secret** - set it (unblocks reverse-match P1-2).
 - [] **Expand the employer test listing past 26 chars** (P1-5) - so it clears the listing-strength pin gate.
 - [] **Walk account creation end-to-end** (signup -> profile write -> first-run) - never exercised by anyone.
 - [] **Confirm the recruiter test-account login** (was timing out).
-

6. PARKED DECISIONS (need a founder call)

- [] **Button *word* vs *icon* centering** (10px, site-wide) - A: keep icon, pin left - B: drop icon. On hold; remind after Sprint C.

[X] **Ghost-% placement** - [x] **RESOLVED + SHIPPED v271 (2026-08-31), mockup approved**
(`scratchpad/ghost-chip-mockup.html`).

Reversed the v245 de-dup hide: the card-face community ghost-risk pill is now SHOWN whenever it has a value (`.s-ghost:not(:empty)`) - N% / - / [x] Verified, color-coded, real-data-only per v119), sitting in the Match group and reading as tappable (opens the drawer's full community breakdown, which is kept). Empty pre-fill state stays hidden. v245 dedup test updated to assert the reversal + a new state test (populated shows / empty hidden / verified [x]).

- [X] **N3 Ghost-page decisions** - [x] **RESOLVED + SHIPPED v257**: (a) flagged companies **do not** surface in your hunt (auto-hidden, undoable); (b) "hiring near your search" is live-pool-sourced (accurate). Deferred: ghost-% placement, button centering.
-

7. TEST: MANUAL TEST CHECKLIST - step-by-step (founder runs these)

Run on a **real device**, **logged in** unless noted, and check **both dark + light** (profile menu -> theme toggle) and **desktop + mobile** (resize the window / open on a phone). Hard-refresh first so you're on the latest build.

T0 - Confirm you're on the current build (do this first, every deploy)

- [] Open `ghostproofjob.com`. In the browser console type `APP_VERSION` (or check "What's New") -> it should read **v269**

(or the version we just shipped). If it's older, you're on a **stale/cached deploy** - hard-refresh (Ctrl/Cmd-Shift-R) or re-upload `index.html`.

T1 - In-app Self-Test (the fastest health check - 19+ checks)

- [] Profile chip (top-right "Aaliyah") -> **Run Self-Test** -> wait for it to finish -> **every row green**.

Any red = tell me the row name; that's a real failure, not a flake.

T-C6 - Signed-out home hero (SHIPPED v255 - test in a logged-OUT / private window)

[] Open `ghostproofjob.com` in a **private/incognito window** (so you're a fresh, logged-out visitor). You should land on the **hero landing page** - big headline "Get answered, not ghosted." that **rotates** through 3 lines, value pillars, a looping demo card, and a green **"Always free"** pill. Check **dark + light** (top-right) and **phone + desktop**.

[] **"Jump straight to swiping"** -> the hero disappears and you're in the app deck. Refresh -> it does **not** come back (you're now a returning visitor). **"Sign in" / "Get started"** -> the login/signup box opens **on top** of the hero.

- [] Sign in -> the hero is gone. Existing (already-signed-in) sessions should **never** see the hero.

T-D2 - Full Inbox tab (SHIPPED v254 - test this build)

[] **Desktop:** the left rail now has **Inbox** (between Ghosts and Account/Profile). Click it -> you land on the Inbox. **Mobile:** tap the **bell** (top-right) -> **Open full Inbox** -> at the bottom of the dropdown.

[] If you have any real messages/interviews/matches, they appear **grouped** (Messages / Interviews / Responses /

etc.), newest first, with an **unread purple tint + dot**; if not, you see an honest **"Nothing here yet"** note.

[] Tap a row -> it takes you to the **live control** for that item (the reply box / interview picker / rating / candidate card) and marks it **read**. Come back to Inbox -> the dot is gone and the "unread" count drops.

[] **Mark all read** clears every dot. Check **both dark + light** and **phone + desktop** - spacing stays clean, and the **mobile bottom nav is unchanged** (still Swipe / Browse / Resume / Ghosts / Employers).

T2 - Company logos (the N1 fix - after we ship it)

[] **Swipe** a few cards + open **Ghosts** -> company logos are either the **real company logo** or the **/ placeholder** - never the blue LinkedIn "in" logo on a non-LinkedIn company. Check dark + light.

T3 - Match % honesty (the N2 fix - after we ship it)

[] **Browse** your list -> the green **"Match"** badge is **not 98% on every card**; a weak/out-of-field role reads a believable lower number. Open a strong match and a weak one -> the numbers differ sensibly.

T4 - Ghost-page (the N3 fix - SHIPPED v257)

[] **Ghosts** -> companies with no community data show **"no reports yet"** (not a bare "-") in the "Around your hunt" cards. Companies under "hiring near your search" come from your live search, so they genuinely have roles.

[] **Flag a company** (file a ghost report on it, or answer "yes, they ghosted me" in the monthly check) -> you see "...is hidden from your hunt". **Swipe/Browse** -> that company's roles no longer appear. ****Settings -> Hidden companies -> the company is listed with an Unhide**** that brings its roles back. Check dark + light.

T5 - Mobile tap targets (the N4 fix - after we ship it)

[] On a **phone**: Sign In, Support Us, **Match to Job**, **Cover Letter**, and the filter chips are **easy to tap** (comfortably thumb-sized, ~44px tall) - none feel like a thin sliver.

T6 - Résumé tailoring / AI quality (B1 - needs the Worker deployed, which it is)

[] **Résumé** -> open a real job -> **Match to Job** -> the reframe touches **only 2-3 bullets**, reads natural (NOT "marketing" stuffed onto every line), and **never invents** a metric/employer/title. **Send me the PDF**.

[] **Cover Letter** on the same job -> no unfilled phrasing ("the this role position"); it names real strengths; if live AI wasn't reachable it **says so** (honest fallback banner).

T7 - Rater + ATS preview (B2)

[] **Résumé** -> **Rate My Résumé** -> two honest labelled scores (writing quality + role fit); the score doesn't swing wildly between visits. **ATS preview** -> what it shows matches your real résumé content (name, titles, skills).

T8 - 5 template exports (D3)

[] **Export Template Studio** -> try each of the **5 templates** (Classic ATS / Modern Split / Minimal /

Corporate Grid / Creative Accent) -> each downloads a clean PDF; toggling accent / headshot / spacing / address doesn't break the layout. Check one in dark and one in light.

T9 - Broaden-location ladder (D4)

[] **Browse** -> the "Show other parts of [State] -> / Show all regions ->" pill widens **only when you tap it** (never on its own). The "Only jobs with posted salary" toggle **filters in place** (doesn't re-pull random regions).

T10 - Both-theme + device sweep (every build)

[] Walk **Swipe - Browse - Résumé - Ghosts - Account** in **dark**, then **light** -> colors match the brand (Midnight Plum / Mint / Cyber Purple), text is readable, nothing off-center or clipped. Repeat on **mobile**.

T11 - Deploy proof (after each deploy)

[] Re-run **T0** on the live site + re-run **T1 Self-Test** -> confirms the deploy is live and healthy, not stale.

T12 - Admin Diagnostics report (the N9 build - after we ship it)

[] On your admin account: **Settings -> admin panel -> Diagnostics** -> you see a **readable list** of recent client errors (grouped, with counts + which browser + which build) AND user bug reports (their words + console trail) - not just the count. Tap **Copy report** -> paste it here so I can resolve the specific issues. _Until this ships, view client errors in the Firebase console (client_errors) and bug reports in your **support@** inbox or Firestore bugReports._

8. How we work each item (the loop)

[UI-REVIEW] mockup + approval (if visual) -> [STATE-COVERAGE] matrix + test -> INSERT-ONLY build (full files) -> **full Matrix Gate, no skips** -> visual proof (before/after, both themes) -> you approve -> I push (with your go-ahead) -> **live-URL post-deploy check** -> update this index + sprint-roadmap.md + BUILD_HISTORY.md.

Last updated: 2026-08-27 - against live build v246.
